Success Story

Increased Network Visibility and Data Security

Stronger Together

Increased Network Visibility and Data Security

Challenge:

Lesaffre Turquie was in need of a centralized security operations solution in order to **ensure data security within its system, monitor and analyze the traffic in the system,** and **prevent potential threats.** The need for an advanced cyber security solution arose under these circumstances:

1 The company had to meet the regulations (R.K and KVKK, etc.) to which it is subject.

2 It had to be determined how the available data would serve the company's investment plans.

3 A highly complex business with factories in a wide variety of regions required a centralized security solution.

In the process meetings, where both parties discussed all these topics, it was decided to carry out the purchasing process from a different perspective.

Solution:

After the purchasing process, the topology was analyzed well. Devices within the environment that can be integrated with Logsign were detected and the planning process was determined accordingly.

The standard rules and correlations that needed to be implemented at the outset were defined. Specifically customized rules designed by working with the IT team, were also incorporated. The logs of the requested servers, databases, firewalls and all other resources began to be collected.

Logsign

In this way, location-based incidents could be analyzed and actions could be taken against them. Prepared report templates were generated to meet location-based dashboards and regulation needs.

Meetings were held periodically with the participation of both parties to analyze the maturity and development of Logsign SIEM. Thus, it became possible to quickly implement Lesaffre's demands.

Results:

→ The automatic action was activated and the frequency of incidents recurrence was reduced by 50% with the firewall integration for critical incidents.

→ The number of alarms decreased by 60% in the first month with the actions taken.

→ The mean time to detect an incident has been significantly reduced.

→ It has become possible to take action as soon as an incident occurs.

→ Now all systems can be monitored from a single point without the need to be in locations.

→ Budget plans have become feasible and understandable.

We have obtained meaningful data with the help of Logsign, which has been working on our systems for about 3 years. Now we are able to examine all our systems from a single point. We have started to create our action plans more smoothly and quickly. Our awareness in the field of security has increased. In addition, we have ensured that our employees share this goal and we have succeeded in raising their awareness.

The important thing was to master the structure of our company and to put the constructed structure on a solid foundation. We can now monitor continuously and take quick action with Logsign SIEM. Also, Logsign has also given us a point of view. We had a very effective and innovative installation process. Their after-sales service and communication made us very satisfied and we have benefited greatly from this. We see that it is an organization that intervenes immediately, makes improvements, and, most importantly, listens to us.
